Role of medicinal plants against Alzheimer’s disease

Abstract
Alzheimer’s is an irreversible and dynamic neurodegenerative ailment which associated with the age and characterized by serious loss of memory, personality changes, uncommon behaviour and decrease in intellectual capacity. Till now no countermeasure available for Alzheimer’s, however symptomatic treatment may enhance memory and other issues related to this disease. Products from natural resources such as medicinal plants have been utilized for the treatment of various memory disorders like amnesia, dementia, Alzheimer’s, Parkinson since long time. Various studies depicted the utilization of therapeutic plants for treatment of Alzheimer’s. In spite of that exact mode of their action is yet indistinct. Phytochemical investigations of various plant parts have demonstrated presence of numerous bioactive compounds, such as polyphenols, tannins, flavonoids, triterpenes, alkaloids and steroids. These compounds demonstrate an extensive variety of pharmacological activities which includes anticholinesterase, antiinflammatory, antiamyloidogenic, hypolipidemic, and antioxidant effects. This review provides the description of different medicinal plants against Alzheimer’s disease.

Keywords: medicinal plants, Alzheimer’s disease, phyto compounds

Introduction
Neurodegenerative ailments are heterogeneous group of genetic disorders that are indicated by loss of neuronal structure, function and generally lead to neuronal loss. These ailments may result directly from particular neuronal population degeneration or indirectly from changes in glial support cells. These kinds of ailments are characterized by an abnormal proteins accumulation or other biological materials accumulation within or outside the neurons. These aggregations take different structures and result in neurofibrillary tangles in Alzheimer’s disease, Lewy bodies in Parkinson’s disease, glycogen and polyglycusan bodies in Lafora disease. Alzheimer’s disease is thought to be in responsible of 60% of all mental disorder in moderately aged or older adults1 and influencing in excess of 5 million Americans, a number assessed to increment to 7.7million by 2030.

Alzheimer’s disease is caused due to aggregation of mis-folded proteins which accumulate fibrillary amyloid deposits in selective regions of central nervous system. Alzheimer’s disease results in memory loss, personality changes, unusual behaviour, and loss of the ability to thinking. Early disease shows short term memory loss, fail to remember names and addresses, failure to learn new information, mood swings, as the condition develops, changes become more prominent and individuals even fail to remember way to home. Frustration, irritability and hostility are usual emotional features showed by AD patients. Seventy percent of Alzheimer’s disease is caused due to genetic factor and twenty one percent is environmental factor. Most cases of Alzheimer’s disease are late-onset which develops after a age of 60.2 At present, most accepted Alzheimer’s disease treatment strategy is inhibitors of cholinesterase which can inactivate acetylcholinesterase (AChE) enzyme in order to enhance the acetylcholine levels in brain. Inhibitors of acetylcholinesterase include rivastigmine, donepezil, tarcine, galantamine and memantine. However, there is no drug for Alzheimer’s disease, besides only calm the disease symptoms.3 Herbal medicine offers an alternative option to modify symptoms and progress of AD.

Products that are derived from plants are carefully standardized, and their safety and efficacy for a particular application have been tested.4 Herbal medicine is indigenous to India and in Ayurveda several preparations of medicine have been developed for various disease treatments. Various scientific investigations have shown the importance of medicinal plants in the enhancement of nervous system function.5 Phytochemical analysis reveals the presence of various bioactive compounds, such as tannins, lignans, polyphenols, flavonoids, sterols, triterpenes and alkaloids in medicinal plants which shows the potential against various problems, including antiamyloidogenic, anti-inflammatory, anti-cholinesterase, hypolipidemic, and antioxidant effects.6 This review provides the description of medicinal plants that possesses promising role in Alzheimer.

Medicinal plants against Alzheimer’s disease
Medicinal plants contain various phyto compounds which are extractable and utilized as raw material for different scientific survey. Various secondary metabolites from plants are commercially essential and utilized in pharmaceutical industries. Recently, medicinal plants have gained wide acceptance because of their fewer side effects compared to the synthetic medicines and necessity to meet the requirement of medicine for increasing human population. However, steady supply of source material often becomes difficult due to various factors like diverse geographical distribution, environmental changes, cultural practices, labour cost, selection of superior plant stock and over exploitation by pharmaceutical industries.7 Several investigations reported that medicinal plants are utilized in the Alzheimer’s disease treatment which includes Centella asiatica, Ginkgo biloba, Withania somnifera, Bacopa monnieri, Salvia officinalis, Melissa officinalis, Tinospora cordifolia, Glycyrrhiza glabra etc.

Withania somnifera (Ashwagandha)

Withania somnifera is largely utilized in Ayurveda as a nerve tonic which supports the body to adapt stress. W. somnifera belongs to Solanaceae family, root of this plant is extensively utilized. It possesses free radical scavenging activity, antioxidant activity,
and enhances immune system.\textsuperscript{8} \textit{W. somnifera} possesses a calming effect whereas other adaptogens tends to stimulate and thus shows positive effects in people with Alzheimer’s disease.\textsuperscript{9} A recent study of \textit{W. somnifera} showed decreased level of stress and inability to concentrate and reversed forgetfulness in a dose-dependent manner in and there is no adverse effects were found [10]. \textit{W. somnifera} contains various phytochemicals which include which includes withanolides A to Y, withisamodienone, withasomiferin A, dehydro withanolide R, withaferin A, withasomiferol A to C, and withanine, phytosterols sitostanodisides VII to X, beta-sitosterol, alkaloids, amino acids and high amounts of iron.\textsuperscript{11} Withanamides showed free radicals scavenging activity that generated during the Alzheimer’s disease initiation and progression. It blocked the death of neuronal cell triggered by amyloid plaques.\textsuperscript{12} Molecular modelling investigations showed that withanamides A and C particularly bind to \(\beta\)-amyloid (A\(\beta\) 25-35) active motif and prevents the formation of fibril.\textsuperscript{13} Aqueous extracts of \textit{W. somnifera} showed the enhanced cholinergic activity by increasing the acetylcholine content and cholineacetyl transferase activity in rats, this shows the cognition-enhancing and memory-improving effects.\textsuperscript{14} In addition to pre- and post-synapses reconstruction in the neurons, methanol extracts of \textit{W. somnifera} reversed the amyloid peptide-induced memory deficit in mice.\textsuperscript{15} These in vivo effects of \textit{W. somnifera} were continuing even after drug termination.

\textbf{Bacopa monnieri (Brahmi)}

\textit{Bacopa monnieri} belongs to Scrophulariaceae family and found in marshy and damp areas. It is commonly utilized in Ayurvedic medicine and act as a nerve tonic, cardiotonic, diuretic and as therapeutic agent against asthma, insomnia, epilepsy, and rheumatism. This plant contains various phytochemicals which includes bacopasides A and B, bacopasides III to V, and bacopasaponins A, B, and C, jujubogenin bisdesmosides bacopasaponins D, E, and F, betulic acid, sterols, asiatic acid, asiaticoside, madecassic acid, vellarin, and horsesoside.\textsuperscript{16} These in vivo effects of \textit{B. monnieri} has been extensively investigated for its neuropharmacological effects and nootropic actions.\textsuperscript{17} In hippocampus, \textit{B. monnieri} increase the protein kinase activity which contributes to its memory enhancing properties.\textsuperscript{18} \textit{B. monnieri} also inhibited cholinergic degeneration and shows enhanced cognition effect in Alzheimer model of rat.\textsuperscript{19} It was reported that a standardized \textit{B. monnieri} extract reversed the cognitive deficits induced by intra-cerebroventricularly administered colchicines and ibotenic acid into the nucleus basalis magnocellularis.\textsuperscript{20} In the same investigation, \textit{B. monnieri} also reversed the acetylcholine depletion, choline acetyltransferase activity reduction, and reduce the muscarinic cholinergic receptor binding in frontal cortex of hippocampus.\textsuperscript{21} \textit{B. monnieri} extract protected the neurons from \(\beta\)-amyloid induced cell death by repressing cellular acetylcholinesterase activity.\textsuperscript{22} \textit{B. monnieri} extract treated neurons showed lower reactive oxygen species level which suggested that \textit{B. monnieri} restrained intracellular oxidative stress.\textsuperscript{23}

\textbf{Centella asiatica (Gotu Kola)}

\textit{Centella asiatica} belongs to Apiaceae family and found throughout India also in Sri Lanka and Bangladesh.\textsuperscript{24} It contains various bioactive compounds which include triterpenes, asiatic acid, asiaticoside, acacessoside, sapogenins, glycosides, madecassic acid, vellarin, and centelloside.\textsuperscript{25} Asiatic acid and asiaticoside showed reduce hydrogen peroxide-induced cell death, decline concentration of free radicals, and \(\beta\)-amyloid cell death inhibition \textit{in vitro} which suggested possible role in Alzheimer’s disease treatment and \(\beta\)-amyloid toxicity prevention.\textsuperscript{26} Extracts of \textit{Centella asiatica} reversed the \(\beta\)-amyloid pathology in mice brains and modulated oxidative stress response components.\textsuperscript{27} It is an important plants for nerve and brain cells and considers being capable of enhancing intellect, memory and longevity.\textsuperscript{28}

\textbf{Ginkgo biloba}

\textit{Ginkgo biloba} belongs to Ginkgoaceae family and indigenous to China. Extract of \textit{G. biloba} used to treat inadequate blood circulation complications, consciousness loss, depression and headaches.\textsuperscript{29} This extract was accounted to contain around 24% of flavonoids and 6% of terpene lactones. There is strong evidence that standardized ginkgo extract demonstrates several molecular and cellular neuroprotective mechanisms, which include apoptosis attenuation, membrane lipid peroxidation inhibition, anti-inflammatory effects and \(\beta\)-amyloid aggregate inhibition. There are considerable clinical examinations in regards to its potential role in cognitive disorders.\textsuperscript{30} Chronic treatment on learning and memory in mice demonstrated that \textit{G. biloba} enhanced acquisition, storage, and retrieval of two-response sequence for food reward.\textsuperscript{31} \textit{G. biloba} influences intellectual capacity in Alzheimer’s disease animal model without altering histopathological consequences of \(\beta\) amyloid precursor protein overexpression.\textsuperscript{32} \textit{G. biloba} extract significantly repress acetylcholinesterase activity in the brain and AChE activity inhibition corresponded with improvement scopolamine-induced deficits in passive avoidance. Decline acetylcholinesterase activity indicates enhance basal level of acetylcholine.\textsuperscript{33}

\textbf{Curcuma longa (Turmeric)}

\textit{Curcuma longa} belongs to Zingiberaceae family and possesses anti-inflammatory activity which is also associated with reduced Alzheimer’s risk.\textsuperscript{34} Curcumin reduces deposition of plaque in the brain. It decreases oxidative stress and amyloid pathology.\textsuperscript{35} Epidemiologic studies showed that in Southeast Asian countries where turmeric is frequently utilized in diet there are 4.4-fold lower cases of Alzheimer.\textsuperscript{36} A study reported that low doses of Curcumin reduced A\(\beta\) level up to 40% in mice with Alzheimer’s disease as compared to control drug. At lower dose curcumin caused 43% decrease in plaque burden that these A\(\beta\) have on the brain of mice with Alzheimer’s disease.\textsuperscript{37} Another study indicates that anti-inflammatory property of turmeric is correlated with a decrease Alzheimer risk.\textsuperscript{38}

\textbf{Glycyrrhiza glabra}

\textit{Glycyrrhiza glabra} belongs to Fabaceae family and contains various bioactive compounds which include linalool oxide, geranial, benzoic acid, terpinen, tetramethyl pyrazine, glycyrrhizin, tannin, and glycyrrhizic acid.\textsuperscript{39} Memory enhancing activity of this plant was reported in scopolamine induced dementia.\textsuperscript{40} Dhingra et al.\textsuperscript{41} reported that in mice \textit{Glycyrrhiza glabra} enhances memory and three dose levels (75, 150, 300mg/kg) of plant extracts were administered to mice in seven successive days and dose at 150mg/kg was found effective in memory enhancement. This could be helpful in the treatment of AD.
Lepidium meyenii

It belongs to Brassicaceae family and is known for its improving learning abilities and memory function. It inhibits acetyl cholinesterase activity. It contains wide range of bioactive compounds which is an alternative source of drugs which have low or negligible side effects. Medicinal plants contain wide range of bioactive compounds which is an alternative source of drugs which have low or negligible side effects. Medicinal plants can boost life quality of patients with AD and memory deficits. This review provides the details about the role of medicinal plants against Alzheimer’s disease. However, mechanisms of action are still not clear. Future clinical trials involving larger sample sizes are required for investigating role of different medicinal plants and the underlying mechanisms.
