

An alert to 2018 FIFA World Cup mind control with brain nanobots - deceiving the VAR

Abstract

The 2018 FIFA World Cup is currently ongoing in Russia. The Video Assistant Referees (VAR) was made official by the FIFA for the World Cup in Russia in order to end the refereeing controversies. this system is considered a total justice for football, VAR and the anti-doping system have an Achilles' heel: The mind control with brain nanobots. Mind control is a reductive process in which a man is reduced to an animal, machine or slave. Nowadays, the mind control could be developed with invasive neurotechnology as brain nanobots that can control directly the activity of victim neurons stimulating or inhibiting them and thus, control different body's functions like the motor functions. It could be used by nanomafias in sports like soccer and could being applied on football players of the teams that are participating, nowadays, in the current world cup. The FIFA should be prepared to avoid the mental control and the illicit use of brain nanobots, as they are regarding drugs using the anti-doping in order to get the justice in world football.

The 2018 FIFA World Cup is the 21st FIFA World Cup, a quadrennial international football that is organized by FIFA. It is currently ongoing in Russia starting from 14 June and will end with the final match on 15 July 2018. The Video Assistant Referees (VAR) was made official by the FIFA for the World Cup in Russia in order to end the refereeing controversies. The FIFA implemented the VAR that is a live support system for referees, which gives them the option of changing decisions that could influence in the scoreboard or in the match incidences although this system is considered the final point for the controversies in refereeing decisions and represent for FIFA and most analysts, a total justice for football.¹ The VAR and the anti-doping system have an Achilles' heel.

The mind control with brain nanobots

Mind control is a reductive process in which a man is reduced to an animal, machine or slave. For the most of society, the mind control is a myth, a science fiction subject or a psychiatric disorder rather than a scientific one; a view that is result from a misinformation campaign in which "science" magazines,² science-fiction films producers and intellectual swindlers participate. Their objective is creating a perception that the mind control is unreal. However, in the 21st century, the advance in neuroscience leads to a scientific reality that is opposite to such message, the mind control is a reality that all citizens shall know and that can affect any person.

The mind control has been planned through history in different ways; the main control operations were performed during the 20th century by institutions like the CIA, being the main one, the MKULTRA program that used mainly hallucinogenic drugs. Nowadays, with the modern science advances, the mind control could be developed with invasive neurotechnology and brain implants like the cortical modem, brain nanobots and microchips that can control directly the activity of victim neurons stimulating or inhibiting them and thus, control different body's functions like the motor functions, thus, an athlete could suffer contraction or paralyzes of legs muscles causing they do not function well. It is necessary to highlight that although scientists of the big transnational promote brain nanobots as innocuous and as a benefit for the society. Nanobots can be used as mind control weapons and can lead to digital slavery (Figure1).^{3,4}

Recent researches alert on the development of the mind control program in the world by the US Army,⁵ however, the mind control could be used as State terrorism, common crime or organized crime weapon for that reason, it could be used by the criminals in sports like soccer and could being applied on football players of the teams that are participating, nowadays, in the current world cup mainly in difficult games soccer like a desperate measure of coaches soccer (Figure 1) (Figure 2).⁶

The actions of nanotechnology mafia are facilitated because nanobots can be administered in foods and drinks. In football, the nanobots as well as the drugs like cocaine or marijuana, can influence on the performance of a football player who could be victim of nanobots, could be subject to mind control, his muscles could be contracted or could be tortured by telemetry with the so-called brain net thus, limiting his play in a world football competition such as in the critical execution of penalties^{7,8} or in passes precision, thus, probably achieving one of the main objectives of nanomafias in football: block a goal.

Conclusion

Mind control is real, it could be developed with invasive neurotechnology as brain nanobots that can control directly the

activity of victim neurons and thus, control different body's functions like the motor functions. It could be used by the criminals in sports like soccer and could be applied on football players of the teams that are participating in 2018 FIFA World Cup is currently ongoing in Russia. The FIFA should be prepared to avoid the mental control and the illicit use of brain nanobots, as they are regarding drugs using the anti-doping in order to get the justice in world football.
