A Proof of the Curious Binomial Coefficient Identity which is Connected with the Fibonacci Numbers

Abstract
We give an elementary proof of the curious binomial coefficient identity, which is connected with the Fibonacci numbers, by using system of auxiliary sums and the induction principle. We discover some interesting relations between main sum and auxiliary sums, where appear the Fibonacci numbers. With help of these relations, we found a second order linear recurrence with main sums only. We easily solve this recurrence by using the Binet formula for the Fibonacci numbers and then prove the desired identity.

Keywords: Binomial coefficient; Fibonacci number; Recurrence equation; Auxiliary sum; Combinatorial identity

Introduction
We consider the following sum with binomial coefficients:

\[ S_k(n) = \sum_{i_1=0}^{n} \sum_{i_2=0}^{n} \ldots \sum_{i_k=0}^{n} \left( \begin{array}{c} n-i_1 \\ i_1 \\ \end{array} \right) \left( \begin{array}{c} n-i_2 \\ i_2 \\ \end{array} \right) \ldots \left( \begin{array}{c} n-i_k \\ i_k \\ \end{array} \right) \]

(1)

Where \( n \) is a non negative integer and \( k \) is a natural number greater than 1. We call this sum \( S_k(n) \) a main sum. Let us denote the \( n \)-th Fibonacci number. Namely, \( F_0 = 0 \), \( F_1 = 1 \), and \( F_n = F_{n-1} + F_{n-2}; \) if \( n \geq 2 \). Our main goal is to prove the following identity:

\[ F_k = F_{k(n+1)} - F_{k} \cdot F_{k-1} - F_{k} \cdot F_{k-1} \cdot P_k(n-1) \]

(2)

We establish our main theorem:

Theorem 1
Let \( n \) be a natural number; and let \( k \) be a natural number greater than 1. Then the following relations hold between main and auxiliary sum:

\[ P_k(n) = \sum_{i_1=0}^{n} \sum_{i_2=0}^{n} \ldots \sum_{i_k=0}^{n} \left( \begin{array}{c} n-i_1 \\ i_1 \\ \end{array} \right) \left( \begin{array}{c} n-i_2 \\ i_2 \\ \end{array} \right) \ldots \left( \begin{array}{c} n-i_k \\ i_k \\ \end{array} \right) \]

(3)

From our main theorem, we derive a second order linear recurrence between main sums only. We have:

Corollary 1
Let \( n \) be a non negative integer; and let \( k \) be a natural number greater than 1. Then the following relation holds:

\[ S_k(n+2) = (F_{k+1} + F_{k-1}) \cdot S_k(n+1) + (F_k^2 - F_{k-1} \cdot F_{k+1}) \cdot S_k(n) \]

(6)

With initial conditions:

\[ S_k(0) = 1 \]

(7)

\[ S_k(1) = F_{k+1} + F_{k-1} \]

(8)

Recall that the Cassini identity states that \( F_k^2 - F_{k-1} \cdot F_{k+1} = (-1)^{k-1} \). By the Cassini identity, the Relation (6) simplifies to
More Definitions

In order to prove main theorem (1), beside the auxiliary sum \( P_l(n) \), we need to define a whole system of auxiliary sums.

Definition 1

Let \( n \) be a natural number; and \( k \) be a natural number greater than 1. Let \( l \) be a natural number such that \( 2^k \leq l \). We define auxiliary sums \( S_{k,l}^n \), as follows:

\[
S_{k,l}^n(n) = \sum_{i_2=0}^{n-1} \sum_{i_3=0}^{n-2} \ldots \sum_{i_l=0}^{n-l+1} \left( \frac{n-i_l}{i_2} \right) \left( \frac{n-i_l}{i_3} \right) \ldots \left( \frac{n-i_l}{i_l} \right)
\]

(10)

Then we define the following sum:

Definition 2

Let \( n \) be a non-negative integer; and \( k \) be a natural integer greater than 1. We define the sum \( S_{k,1}^n(n) \), as follows:

\[
S_{k,1}^n(n) = \sum_{i_2=0}^{n} \sum_{i_3=0}^{n} \ldots \sum_{i_k=0}^{n-k+1} \left( \frac{n-i_2}{i_3} \right) \left( \frac{n-i_3}{i_4} \right) \ldots \left( \frac{n-i_k}{i_{k+1}} \right)
\]

(14)

In other words, if we set \( i_n = n \) in the main sum \( S_{k,1}^n(n) \), we get the sum \( S_{k,1}^{n-1}(n) \). In order to calculate the sum \( S_{k,1}^{n-1}(n) \), we need to define one more sum:

Definition 3

Let \( n \) be a non-negative integer; and \( k \) be a natural integer greater than 3. Let \( j \) be a non-negative integer such that \( j \leq n \). We define the sum \( \Delta_{k,j}^n(n) \), as follows:

\[
\Delta_{k,j}^n(n) = \sum_{i_2=0}^{n-j} \sum_{i_3=0}^{n-j} \ldots \sum_{i_k=j-1}^{n-j-k+2} \left( \frac{n-j-i_2}{i_3} \right) \left( \frac{n-j-i_3}{i_4} \right) \ldots \left( \frac{n-j-i_k}{i_{k-1}} \right)
\]

(15)

There is a connection between these two sums from the Definition (2) and Definition (3). Namely, when \( k \geq 4 \), the following equation holds

\[
S_{k,1}^{n-1}(n) = \Delta_{k,0}^n(n)
\]

(16)

The Equation (16) is true because of the fact that \( i_n = n \) implies that both \( i_n \) and \( i_k \) must be equal to zero.

Main Lemmas

Before we prove main theorem (1), we need to prove several lemmas. Here, we give a list of all lemmas which are important for us.

Lemma 1

Let integers \( n, k, \) and \( l \) be from the Definition (1); with condition \( l \leq k \). Then the following equation holds

\[
S_{k,l}^n(n) = S_{k+1,l}^n(n) + S_{k,l-1}^n(n)
\]

(17)

Corollary 2

Let integers \( n, k, \) and \( l \) be from the Definition (1); with condition \( l \leq k \). Let \( m \) be a non-negative integer such that \( 1 \leq m \leq l \).

Then following equations hold

\[
S_{k,1}^n(n) = F_{n+1} \cdot S_{k,1}^{n-1}(n) + F_{n} \cdot S_{k,1}^{n-2}(n)
\]

(18)

\[
S_{k,2}^n(n) = F_{k} \cdot S_{k,1}^{n-1}(n) + F_{k-1} \cdot S_{k,1}^{n-2}(n)
\]

(19)

Lemma 2

Let \( n \) be a non-negative integer; and \( k \) be a natural integer greater than 1. The following relation holds

\[
P_k(n) = S_{k,2}^n(n)
\]

(21)

Lemma 3

Let \( n, k, \) and \( j \) be from the Definition (3). Then the following equation holds:

\[
\Delta_{k,j}^n(n) = \frac{F^j}{F^{k-1}}
\]

(22)

Lemma 4

Let \( n \) and \( k \) be from the Definition (2). Then the following equation holds:

\[
S_{k,1}^{n-1}(n) = F_{k-1}^n
\]

(23)

A Proof of the Lemma (1)

Our proof of the Equation (17) relies on the well-known Pascal’s formula for binomial coefficients:

\[
\binom{n}{k} = \binom{n-1}{k} + \binom{n-1}{k-1}
\]

(24)
Where \( n \) is a natural number and \( k \) may be an arbitrary integer.

Due to the Definition (1), our proof consists of four parts. All proofs of these four parts are very similar. We prove three cases and give a sketch of a proof for the fourth case.

**Proof**

a. The first case: \( l = 1 \). Since \( i_1 \leq n - 1 \), we can apply the Pascal formula on the binomial coefficient \( \binom{n-1}{i_1} \).

We have gradually:

\[
S_{k,1}(n) = \sum_{i_1=0}^{n} \cdots \sum_{i_k=0}^{n} \binom{n-1-i_1}{i_1} \cdots \binom{n-1-i_k}{i_k}
\]

\[
= \sum_{i_2=0}^{n} \sum_{i_3=0}^{n} \cdots \sum_{i_k=0}^{n} \left( \binom{n-1-i_1}{i_2} \cdots \binom{n-1-i_k}{i_k} \right) \cdot \binom{n-1-i}{n-i_k}
\]

The Equation (26) becomes gradually:

\[
S_{k,2}(n) = \sum_{i_2=0}^{n} \sum_{i_3=0}^{n} \cdots \sum_{i_k=0}^{n} \left( \binom{n-1-i_1}{i_2} \cdots \binom{n-1-i_k}{i_k} \right) \cdot \binom{n-1-i}{n-i_k}
\]

Note that the first binomial coefficient in the Equation (25) perishes if \( i_2 = n \). Therefore, we have

\[
S_{k,2}(n) = \sum_{i_3=0}^{n} \cdots \sum_{i_k=0}^{n} \left( \binom{n-1-i_1}{i_3} \cdots \binom{n-1-i_k}{i_k} \right) \cdot \binom{n-1-i}{n-i_k}
\]

b. The second case: \( l = k \). Since \( i_k \leq n - 1 \), we can apply the Pascal formula on the binomial coefficient \( \binom{n-1}{i_k} \).

We have gradually:

\[
S_{k,k}(n) = \sum_{i_1=0}^{n} \cdots \sum_{i_k=0}^{n} \left( \binom{n-1-i_1}{i_2} \cdots \binom{n-1-i_k}{i_k} \right) \cdot \binom{n-1-i}{n-i_k}
\]

The Equation (26) becomes gradually:

\[
S_{k,k}(n) = \sum_{i_1=0}^{n} \cdots \sum_{i_k=0}^{n} \left( \binom{n-1-i_1}{i_2} \cdots \binom{n-1-i_k}{i_k} \right) \cdot \binom{n-1-i}{n-i_k}
\]

\[
= \sum_{i_3=0}^{n} \cdots \sum_{i_k=0}^{n} \left( \binom{n-1-i_1}{i_3} \cdots \binom{n-1-i_k}{i_k} \right) \cdot \binom{n-1-i}{n-i_k}
\]

The third case: \( l = k - 1 \). Since \( i_{k-1} \leq n - 1 \), we can apply the Pascal formula on the binomial coefficient \( \binom{n-1}{i_{k-1}} \).

We have gradually:

\[
S_{k,k-1}(n) = \sum_{i_1=0}^{n} \cdots \sum_{i_{k-1}=0}^{n} \left( \binom{n-1-i_1}{i_2} \cdots \binom{n-1-i_{k-1}}{i_{k-1}} \right) \cdot \binom{n-1-i}{n-i_{k-1}}
\]

If \( s(n-1) \), then the above sum in the Equation (28) is \( S_k(n-1) \) according to the Equation (1). Due to the Equation (12) from the Definition (1), we have that \( S_k(n-1) = S_{k,k+1}(n) = S_{k,3}(n) \).

If \( k > 2 \), then the above sum in the Equation (28) is, as follows:
A Proof of the Curious Binomial Coefficient Identity which is Connected with the Fibonacci Numbers

\[ S_{k,j-1}(n) = S_{k,j}(n) + S_{k,j+1}(n) \]

From our induction hypothesis and the Equation (31), we have that

\[ S_{k,j}(n) = F_{m+1} \cdot S_{k,j,m}(n) + F_m \cdot S_{k,j,m+1}(n) \]
\[ = F_{m+1} \cdot (S_{k,j,m+1}(n) + S_{k,j,m+2}(n)) + F_m \cdot S_{k,j,m+1}(n) \]
\[ = (F_{m+1} + F_m) \cdot S_{k,j,m+1}(n) + F_{m+1} \cdot S_{k,j,m+2}(n) \]
\[ = F_{m+2} \cdot S_{k,j,m+1}(n) + F_{m+1} \cdot S_{k,j,m+2}(n) \]

From the last equation above, it follows that Equation (18) is satisfied for \( m + 1 \); where \( 0 < m + 1 \leq k + 1 - l \). Therefore, the step of induction is proved. By the induction principle, the proof of the Equation (18) is completed.

A proof of the Equation (19)

Proof: The proof is straightforward. Just set \( l = 1 \) and \( m = k \) in the Equation (18). This is allowed, because \( m \leq k + 1 - l \), so \( m \leq k \). From the Equation (18), we get

\[ S_{k,j}(n) = F_{k+1} \cdot S_{k,j+1}(n) + F_k \cdot S_{k,j+2}(n) \]
\[ = F_{k+1} \cdot S_k(n-1) + F_k \cdot P_k(n-1) \]

(32)

According to the Equations (12) and (13) from the Definition (1). The Equation (32) is our desired the Equation (19). This proves the Equation (19)

A proof of the Equation (20)

Proof: Again, this proof is straightforward. Just set \( l = 2 \) and \( m = k - 1 \) in the Equation (2). Since, \( m \leq k + 1 - l \), this is allowed.

From the Equation (18), we get

\[ S_{k,2}(n) = F_k \cdot S_{k,0+1}(n) + F_{k-1} \cdot S_{k,0+2}(n) \]
\[ = F_k \cdot S_k(n-1) + F_{k-1} \cdot P_k(n-1) \]

(33)

According to the Equations (12) and (13) from the Definition (1). The Equation (33) is our desired the Equation (20). This proves the Equation (20) and completes the proof of the Corollary (2).

A proof of the Lemma (2)

Proof: This proof immediately follows from the Equation (3) and the Definition (1). We need to introduce the substitution \( t_i = i_i - 1 \). We have:
Now, we introduce the substitution $t_i = i_i - 1$. Then the last equation above becomes

$$P_k(n) = \sum_{i_1=0}^{n-1} \sum_{i_2=0}^{n-1} \ldots \sum_{i_k=0}^{n-1} \binom{n-1-t_1}{i_1} \binom{n-i_2}{i_2} \cdots \binom{n-i_k}{i_k}$$

$$= \sum_{i_1=0}^{n-1} \sum_{i_2=0}^{n-1} \ldots \sum_{i_k=0}^{n-1} \binom{n-i_1}{i_1} \binom{n-i_2}{i_2} \cdots \binom{n-i_k}{i_k}$$

According to the Equation (11) from the Defination (1). The Equation (34) completes the proof of the Lemma (2).

**A proof of the Lemma (3)**

**Proof**

We give a proof of the Lemma (3) by using the induction principle on $k$. We start with $k = 4$. By the Defination (3), we have

$$\Delta_{k,i}(n) = \sum_{i=0}^{n-j} \binom{n-j}{i}$$

$$= 2^{n-j} \text{ (by the binomial theorem)}$$

$$= F_{k,i} \cdot F_{k}^{n-j}$$

$$= F_{k-2} \cdot F_{k-3}^{n-j}$$

$$= F_{k-3} \cdot F_{k-4}^{n-j} \text{ (by the binomial theorem)}$$

The last equation above proves the base of induction. Let us suppose that the Equation (22) holds for some $k \geq 4$. This is our induction hypothesis. Let us consider $\Delta_{k,i+1,j}$.

$$\Delta_{k+1,i,j}(n) = \sum_{i=0}^{n-j} \binom{n-j}{i}
\sum_{i_1=0}^{n-i_1} \binom{n-i_1}{i_1} \sum_{i_2=0}^{n-i_2} \binom{n-i_2}{i_2} \cdots \sum_{i_k=0}^{n-i_k} \binom{n-i_k}{i_k}$$

$$= \sum_{i=0}^{n-j} \binom{n-j}{i} \cdot \Delta_{k,i}(n). \quad (35)$$

By the induction hypothesis, it follows that

$$\Delta_{k+1,i,j}(n) = F_{k-2}^{i} \cdot F_{k-3}^{n-j}$$

By the Equation (36), the Equation (35) becomes

$$\Delta_{k+1,i,j} = \sum_{i=0}^{n-j} \binom{n-j}{i} \cdot F_{k-2}^{i} \cdot F_{k-3}^{n-j-i}$$

$$= \sum_{i=0}^{n-j} \binom{n-j}{i} \cdot F_{k-2}^{i} \cdot F_{k-3}^{n-j-i}$$

$$= F_{k-1}^{j} \cdot (F_{k-2} + F_{k-3})^{n-j} \text{ (by the binomial theorem)}$$

$$= F_{k-1}^{j} \cdot F_{k}^{n-j}. \quad (37)$$

The Equation (37) proves the step of the induction principle. This completes the proof of the Lemma (3).

**A proof of the Lemma (4)**

It is easily verified, by direct calculation, that

$$S_{2,j} = n \cdot F_{2}$$

So, we can conclude, from the above equations, that

$$S_{k+1,0} = n \cdot F_{k}$$

Therefore, the Equation (22) is true, when $k = 2$ and $k = 3$.

Now, let us suppose that $k \geq 4$. According to the Equations (16) and (22), we have that

$$S_{k+1,j} = \Delta_{k,j}(n) (\text{by the Equation (16)})$$

$$= F_{k-2}^{0} \cdot F_{k-3}^{n-j} (\text{by the Equation (16)})$$

$$= F_{k}^{n-j}. \quad (40)$$

The Equations (38), (39), and (40) prove the Equation (23). This completes the proof of the Lemma (4).

**A proof of the Theorem (1)**

**Proof**

Let $n$ be a natural number. First, we prove the Equation (4). Due to the Equation (10) from the Defination (1) and the Defination (3), we know that:

$$S_{k}(n) = S_{k,1}(n) + S_{k,j+1}(n). \quad (41)$$
By Equations (19) and (23), the Equation (41) becomes

$$S_k(n) = (F_{k+1} \cdot S_k(n-1) + F_k \cdot P_k(n-1)) + F_k^n.$$  

The last equation above proves the Equation (4). Now, we prove the Equation (5).

The proof of the Equation (5) immediately follows from the Equations (20) and (21).

$$P_k(n) = S_k(n) \text{(by the Equation (21))}$$

$$= F_k \cdot S_k(n-1) + F_{k+1} \cdot P_k(n-1) \text{(by the Equation (22))}$$

The last equation above proves the Equation (5). This completes the proof of the Theorem (1).

A Proof of the Corollary (1)

Proof

The Corollary (1) directly follows from the Theorem (1) and from its Equations (4) and (5). Let us suppose that \( n \) is a natural number. First, we prove the Equation (6). We express sums \( P_k(n) \) and \( P_k(n-1) \) by main sums with help of the Equation (4). Then we use the Equation (5), in order to get relation between main sums only. First, from the Equation (4), we obtain that:

$$P_k(n) = S_k(n) - F_{k+1} \cdot S_k(n-1) - F_k^n.$$  

(42)

If we use the substitution \( n - 1 = t \), the Equation (42) becomes

$$P_k(t) = S_k(t+1) - F_{k+1} \cdot S_k(t) - F_k^{t+1}.$$  

(43)

Where \( t \) is a non negative integer. Therefore, when \( n \) is a natural number, the Equation (43) implies that

$$P_k(n) = S_k(n+1) - F_{k+1} \cdot S_k(n) - F_k^{n+1}.$$  

(44)

Now, we use the Equation (5). By Equations (42) and (44), the Equation (5) becomes gradually:

$$S_k(n+1) - F_{k+1} \cdot S_k(n) - F_k^{n+1} = F_k \cdot S_k(n-1) + F_{k+1} \cdot S_k(n-1) - F_k^n.$$  

If we use the substitution \( n - 1 = t \), the last equation above becomes

$$S_k(t+2) = (F_{k+1} + F_{k-1}) \cdot S_k(t+1) + (F_k^2 - F_{k-1} \cdot F_{k+1}) \cdot S_k(t);$$  

(45)

Where \( t \) is a non negative integer. The Equation (45) is same as the Equation (6). Therefore, the Equation (6) is proved. Now, we prove Equations (7) and (8). The Equation (7) directly follows from the Equation (1). Obviously, from the Equation (3), it follows that

$$P_k(0) = 0.$$  

(46)

Therefore, the Equation (8) follows from Equations (4), (7), and (46). We set \( n = 1 \) in the Equation (4).

$$S_k(1) = F_{k+1} \cdot S_k(0) + P_k(0) + F_{k+1}^3$$

$$= F_{k+1} \cdot 1 + 0 + F_{k+1}^3$$

$$= F_{k+1} + F_{k-1}.$$  

The last equation above proves the Equation (8). This proves the Corollary (1).

A Proof of the Identity (2)

Finally, we prove our main Identity (2). We use the Corollary (1) and the Binet formula for the Fibonacci numbers. Recall that the Binet formula states that

$$F_n = \frac{1}{\sqrt{5}} \left[ \left( \frac{1 + \sqrt{5}}{2} \right)^n - \left( \frac{1 - \sqrt{5}}{2} \right)^n \right]$$  

(47)

Further, we use facts that

$$\frac{1 + \sqrt{5}}{2} = F_{k+1} + F_{k-1} + F_k \cdot \sqrt{5};$$  

(48)

$$\frac{1 - \sqrt{5}}{2} = F_{k+1} + F_{k-1} - F_k \cdot \sqrt{5}.$$  

(49)

Namely, Equations (48) and (49) are consequences of following relations:

$$\left( \frac{1 + \sqrt{5}}{2} \right)^t = F_{k+1} \cdot t + F_{k-1};$$

$$\left( \frac{1 - \sqrt{5}}{2} \right)^t = F_k \cdot t + F_{k+1};$$

Which can be easily proved by the induction principle. Proof:

The characteristic equation of the recurrence (6) is

$$\lambda^2 - (F_{k+1} + F_{k-1}) \cdot \lambda + (F_{k+1} \cdot F_{k-1} - F_k^2) = 0.$$  

(50)

The discriminant of the Equation (50) is, as follows

$$D = (F_{k+1} + F_{k-1})^2 - 4 \cdot (F_{k+1} \cdot F_{k-1} - F_k^2)$$

$$= (F_{k+1} - F_{k-1})^2 + 4 \cdot F_k^2$$

$$= F_k^2 + 4 \cdot F_k^2.$$  

(by the definition of the Fibonacci numbers)

$$= 5 \cdot F_k^2.$$
From the last equation above, it follows that
\[ D = 5 \cdot F_k^2. \] 
(51)

By using the Equation (51), it follows that roots of the Equation (50) are
\[ \lambda_1 = \frac{F_{k+1} + F_{k-1} + F_k \cdot \sqrt{5}}{2}; \] 
(52)
\[ \lambda_2 = \frac{F_{k+1} + F_{k-1} - F_k \cdot \sqrt{5}}{2}. \] 
(53)

Equations (52) and (53) can be written, as follows:
\[ \lambda_1 = \left( \frac{1 + \sqrt{5}}{2} \right)^k; \] 
(54)
\[ \lambda_2 = \left( \frac{1 - \sqrt{5}}{2} \right)^k. \] 
(55)

By using Equations (48) and (49). The general solution of the Equation (6) is, as follows:
\[ S_k(n) = C_1 \cdot \lambda_1^n + C_2 \cdot \lambda_2^n \]
\[ = C_1 \cdot \left( \frac{1 + \sqrt{5}}{2} \right)^n + C_2 \cdot \left( \frac{1 - \sqrt{5}}{2} \right)^n. \] 
(Eqns(54)and(55)
\[ = C_1 \cdot \left( \frac{1 + \sqrt{5}}{2} \right)^n + C_2 \cdot \left( \frac{1 - \sqrt{5}}{2} \right)^n. \] 
(56)

By Equations (7) and (8), from the Equation (56), we evaluate constants \( C_1 \) and \( C_2 \). We get a system of equations, as follows:
\[ C_1 + C_2 = 1; \] 
(57)
\[ C_1 \cdot \left( \frac{1 + \sqrt{5}}{2} \right)^k + C_2 \cdot \left( \frac{1 - \sqrt{5}}{2} \right)^k = F_{k+1} + F_{k-1}. \] 
(58)

After short calculation, from Equations (57) and (58), we obtain that
\[ C_1 = \frac{1}{\sqrt{5} \cdot F_k} \cdot \left( \frac{1 + \sqrt{5}}{2} \right)^k; \] 
(59)
\[ C_2 = \frac{-1}{\sqrt{5} \cdot F_k} \cdot \left( \frac{1 - \sqrt{5}}{2} \right)^k. \] 
(60)

By using Equations (59) and (60), the Equation (56) becomes gradually
\[ S_k(n) = \frac{1}{\sqrt{5} \cdot F_k} \cdot \left[ \left( \frac{1 + \sqrt{5}}{2} \right)^n - \left( \frac{1 - \sqrt{5}}{2} \right)^n \right] \]
\[ = \frac{1}{\sqrt{5} \cdot F_k} \cdot \left[ \left( \frac{1 + \sqrt{5}}{2} \right)_{k+1} - \left( \frac{1 - \sqrt{5}}{2} \right)_{k+1} \right] \]
\[ = \frac{1}{F_k} \cdot \left( \frac{1 + \sqrt{5}}{2} \right)^{(k+1)} \cdot \left( \frac{1 - \sqrt{5}}{2} \right)^{(k+1)}. \]
(60)
\[ = \frac{1}{F_k} \cdot \left( F_{k+1} \right) \right). \ (theEquation (47))
\[ = \frac{F_{k+1}}{F_k}. \]

The last equation above proves the Equation (2). This completes the proof of the Equation (2).
