Isolation and Biological Activity of β-Sitosterol and Stigmasterol from the Roots of Indigofera heterantha

Abstract

In the ongoing phytochemical studies the roots of Medicinal plant known as *Indigofera heterantha* were investigated phytochemically in order to explore its medicinal potential. The ethyl acetate fraction was subjected to column chromatography which resulted in the isolation and purification of two new source compounds known as β-sitosterol (1) and Stigmasterol (2). The structures of these compounds were established by using Mass Spectrometry. The structures of these compounds were further authenticated by comparison with the literature data. The isolated pure compounds were screened for antioxidant and membrane stabilizing activities. The antidiabetic activity of β-sitosterol (1) was measured on the basis of the glucose uptake in yeast cells. The results obtained revealed that β-sitosterol (1) exhibited significantly antidiabetic activity at all glucose concentrations with minimum increase 66.48% at 10 µg/ml and maximum increase 74.46% at 80 µg/ml glucose concentration. The Stigmasterol (2) showed good membrane stabilizing activity in HRBC, the minimum stabilization 62.74% at 10 µg/ml and maximum stabilization 65.19% at 40 µg/ml. These results showed that this plant is very important from medical point of view and it needs further phytochemical investigation to explore its hidden medicinal potential.

Keywords: β-sitosterol; Stigmasterol; *Indigofera heterantha*; Antidiabetic; Anti-inflammatory

Introduction

The *Fabaceae* family (*Leguminosae*) consists of approximately 650 genera and 18,000 species, it is one of the largest Angiosperm families [1,2]. The genus *Indigofera* comprises around 700 species that are distributed geographically in tropical regions [3]. *I. heterantha* locally known as ghoreja or kainthaye (in Pashto), Jangli methi (in Urdu) and Himalayan Indigo (in English) extensively spread in Northern regions of Pakistan and possessing high medicinal importance in the indigenous system of medicine. It is a shrub of 30 to 60 cm tall and the leaves are imparipinnately compound, while the fruits are long cylindrical 1.5 cm with 10-12 seeds [4]. *I. heterantha* is used as herbal medicine as well as folk medicine to treat gastrointestinal disorder and abdominal pain [4]. *I. heterantha* roots showed antioxidant, free radical scavenging activity and antidiabetic activity using Glucose uptake in yeast cells assay [5]. Various constituents have been isolated from the *I. heterantha* exhibited inhibitory activity against the enzyme lipoygenase [6]. Other compounds like saponins, quinines, tannins, garlic acid, caffeic acid, myricetin, quercetin myricetin lipoxygenase [6]. Other compounds like saponins, quinines, tannins, garlic acid, caffeic acid, myricetin, quercetin myricetin lipoxygenase [6]. Other compounds like saponins, quinines, tannins, garlic acid, caffeic acid, myricetin, quercetin myricetin lipoxygenase [6]. Other compounds like saponins, quinines, tannins, garlic acid, caffeic acid, myricetin, quercetin myricetin lipoxygenase [6].

Materials and Methods

Plant material

*I. heterantha* roots were collected during the month of September, 2015 from District Swat, KPK, Pakistan. The identification of plant was done at the Department of Botany, Hazara University, Mansehra, Pakistan. The plant material was washed and shade dried for fifteen days then chopped and powdered using a grinder.

Extraction and isolation

The freshly collected air-dried powdered plant material (5 Kg) was extracted by maceration in methanol for 10 days with (10 L) methanol at room temperature. Methanol extract was concentrated to get semi solid extract (900g) through rotary evaporator. This dried crude methanol extract was suspended in distilled water and then partitioned with different organic solvents polarity gradient wise i.e. n-hexane, chloroform, ethyl acetate and methanol in increasing order of polarity three time each by using separating funnel. The ethyl acetate fraction (70g) was subjected to column chromatography on a silica gel 60 (70-230 mesh). The Column was packed and eluted with mobile phase of organic solvents polarity gradient wise i.e. n-hexane, chloroform and methanol. Collected fractions were concentrated to get semi purified sub fractions through rotary evaporator.
Fraction 1 which was eluted with n-hexane: chloroform give single spot on TLC and resulted in the isolation of a pure compound (1), while the fraction 2 which was eluted with chloroform, ethyl acetate and methanol were combined on the basis of TLC profile and process for repeated column chromatography and eluted with 100% n-hexane with increasing solvent polarity gradient gives 22 sub fractions. In all these 22 sub fractions, only seven fractions give spot on TLC plate with similar RF which were combined and resulted in the isolation of a pure compound (2).

Spectroscopic characterization

The isolated compounds were confirmed for their purity and mass determination on Joel mass spectrometer and in comparison, with their literature data.

**Antidiabetic activity**

Commercial baker’s yeast was dissolved in distilled water. It was kept overnight at room temperature. The yeast cell suspension was washed by centrifugation at 4200 rpm (Microfuge® 16 Centrifuge, FX241.5P Rotor, 50/60Hz and 220-240V) in distilled water for 5 minutes. The process was repeated again and again until clear supernatant fluids were obtained. 1% suspension of yeast cells with distilled water was prepared. 5 mM glucose solution was prepared in distilled water. 1 mg of the β-sitosterol (1) was dissolved in DMSO for stock solution. Various concentrations (10µg, 20µg, 40µg, 60µg, 80µg) in DMSO, 1ml Glucose and 100µl of yeast was used to prepare reaction mixture for evaluation of the antidiabetic activity. The reaction mixture was vortexed and incubated further for 60 minutes at 37°C. After one hour of incubation of the reaction mixture, the tubes were centrifuged for 5 minutes at 3800 rpm. Glucose left behind in the supernatant was estimated by measuring the absorbance via spectrophotometer (UV 5100B spectrophotometer) at 520 nm. The percent increase in uptake was calculated by the formula.

\[
\text{% increase in glucose uptake} = \frac{\text{Absorbance of control} - \text{Absorbance of sample}}{\text{Absorbance of control}} \times 100
\]

**Anti-Inflammatory activity**

For preparation of red blood cells suspension, 5ml Blood was obtained from volunteer in heparinized tubes, who have not used non-steroidal anti-inflammatory drugs for at least a couple of weeks before the experiment. The blood was transferred to the centrifuge tubes. The tubes were centrifuged at 3000 rpm for 15 min at room temperature. The blood was washed with equal volume of normal saline 0.9% NaCl solution pH 7.4 (w/v) for a few times, along with removing supernatant carefully until supernatant became clear. The volume of blood was measured and reconstituted as 10% v/v suspension with normal saline.

\[
\text{Percent (%)} \text{HRBC membrane stabilization} = \frac{\text{Absorbance of control} - \text{Absorbance of sample}}{\text{Absorbance of control}} \times 100
\]

**Results and Discussion**

**Structure elucidation of β-sitosterol (1)**

The compound (1) was isolated as a colorless needle like crystals having melting point 135-137 °C, and its mass spectral data (Figure 1) confirmed that molecular ions peaks appeared at 414.4 correspond to molecular formula C_{29}H_{48}O. Different ion peaks observed at m/z 297.1, 191.1, 166.9, 148.9, 113.0, 95.9, 83.0, 56.9, 42.9. Further spectroscopic data matched with the literature Habib. Thus, the structure of compound (1) was established as β-sitosterol (Figure 2).

**Structure elucidation of Stigmasterol (2)**

The compound (2) was isolated in the form of white powder having melting point 173-177 oC, and its mass spectral data (Figure 3) revealed that the molecular ions peaks appeared at 412.4 correspond to molecular formula C_{30}H_{48}O. Different ion peaks observed at m/z 336.1, 319.1, 306.0, 279.2, 256.2, 185.0, 167.0, 149.0, 125.0, 113.0, 97.0, 83.0, 71.0, 56.9, 42.9. The spectroscopic data matched with the literature Habib. Thus, compound (2) was assigned as Stigmasterol (Figure 4).

**Antidiabetic activity of β-sitosterol (1)**

The in vitro assays of the present study indicated that β-sitosterol possess good anti diabetic activity. In Yeast glucose transport takes place through facilitated diffusion. The rate of glucose transport across cell membrane in yeast cells system is presented in (Figure 5). In the ongoing study glucose uptake by the yeast cell at different glucose concentrations i.e. 10, 20, 40, 60, 80µg/ml was performed. The results obtained revealed that β-sitosterol exhibited significantly higher activity at all glucose concentrations with minimum increase 66.48% at 10µg/ml and maximum in crease 74.46% at 80µg/ml glucose concentration. The results clearly indicated that β-Sitosterol had greater efficiency in increasing the glucose uptake by yeast cells as compared to standard drug Metronidazole 50% at 10µg/ml and 81.37 at 80µg/ml.

Anti-Inflammatory activity of Stigmasterol (2)

The reticence of hypotonicity induced HRBC membrane lysis i.e., stabilization of HRBC membrane was ascribed as a measure of the anti-inflammatory activity. The percentage of membrane stabilization for Stigmasterol and standard drug Indomethacin were done at 10μg/ml, 20μg/ml, 30μg/ml and 40μg/ml respectively as given in (Figure 6). This revealed the minimum stabilization 62.74% at 10μg/ml and maximum stabilization 65.19% at 40μg/ml as compared to standard drug 64.70% at 10μg/ml and 60.29% and 40μg/ml. With the increase in concentration the membrane hemolysis is lowered and membrane protection/stabilization is amplified as shown in (Figure 6). Thus, the anti-inflammatory activity of Stigmasterol was found to be concentration dependent.

Conclusion

The phytochemical investigation on the roots of Indigofera heterantha resulted in the isolation of two new source compounds. The structures of the isolated compounds were identified as β-sitosterol (1) and Stigmasterol (2) on the basis of spectroscopic techniques and by comparing their physical properties reported in the literature. The biological testing revealed that the β-sitosterol (1) showed significant anti-diabetic activity while the Stigmasterol (2) showed good membrane stabilizing activity in HRBC.
