

Hematological manifestations in patients with newly diagnosed pulmonary tuberculosis

Introduction

Tuberculosis (TB), particularly TB is still a major public health problem of the world. Pulmonary eosinophilia,^{1,2} Hypereosinophilia,³ Reactive thrombocytosis,^{4–6} Thrombocytopenia,⁷ Disseminated intravascular coagulation,⁸ Deep venous thrombosis,⁹ Henoch-Schonlein purpura,^{10–12} Leukocytosis with neutrophilia,^{7,13} Lymphocytopenia,^{11,14} Monocytopenia, Lymphocytosis, Monocytosis,⁷ Severe leucopenia,^{7,15} Idiopathic thrombocytopenic purpura,^{16,17} Pancytopenia^{7,13,18} Could be found in patients with newly diagnosed pulmonary TB.

Hereditary glucose-6-phosphate dehydrogenase deficiency and pulmonary tuberculosis

A study in Azerbaijan, a state of former Soviet Union demonstrated that the etiological role of this abnormality as a genetic marker for pulmonary TB was 14% in associated pulmonary tuberculosis and alcoholism, it grew to 18%.¹⁹ Another study in this region also showed a high incidence of this hereditary disorder among patients with pulmonary TB.²⁰

Hematological malignancies and pulmonary tuberculosis

Pulmonary military TB have been reported among patients with acute myeloid leukemia, chronic myeloid leukemia, acute lymphocytic leukemia, Hodgkin's disease, T-cell lymphoma and myelodysplastic syndrome.^{21–23}

Sickle cell disease and tuberculosis

Sickle cell disease was reported in patients with TB in France and Africa.^{24–26} Many reports suggest that severe pulmonary TB in association with reduced tissue cellular reaction may cause blood dyscrasias. Anemia was present in 32% of cases. Leucopenia with neutropenia and lymphopenia was seen in 15% of patients with very severe clinical TB. Active tuberculosis was associated with significant reductions in absolute numbers of B lymphocytes, but there were no significant differences in total T8-cell counts.¹⁵ There was reversal of T4//T8 ratio due to T4 lymphopenia. A study in Nigeria showed that 95% had normochromic picture while 5% demonstrated anisopoikilocytosis and polychromasia. The mean platelet counts did not change significantly from the initial value.²⁷
