<i>Myroides</i>	Intrinsic: immunosuppression.	Biofilm (co- and self-aggregation) facilitated with higher glucose concentration; polysaccharide capsule (hydrophobic surface); <i>bauE</i> gene (competing with the hosts to acquire iron); adherence; capacity to survive intracellularly and in human stomach; easy dissemination; capacity to destroy human tissues.	TMP-SMX.	Piperacillin/tazobactam; ticarcillin/clavulanate; ceftazidime/avibactam; imipenem; meropenem; fluoroquinolones; aminoglycosides; fosfomycin; nitrofurantoin; polymyxin. Expresses β-lactamase.	MALDI-TOF MS confirmed by 16S rRNA gene sequence analysis.	2
<i>Ochrobactrum</i>	Intrinsic: immunocompromise d; posterior urethral valve.	Adherence properties.	Fully: amikacin; levofloxacin; meropenem; TMP-SMX. Intermediate: gentamicina.	Beta-lactams; aztreonam; chloramphenicol.	DNA sequencing.	4
<i>Raoultella</i>	Intrinsic: immunosuppressed status; comorbidities (diabetes, chronic renal failure).	Rapid multiplication in isotonic solutions.	Amoxicillin/clavulanic acid; ceftriaxone; ceftazidime; cefuroxime; ciprofloxacin; gentamicin; TMP-SMX; nitrofurantoin.	Ampicillin; fosfomycin.	MALDI-TOF MS (bioMérieux); VITEK-2 Compact system (bioMérieux).	5

<i>Rao ulte lla orni thin olyt ica (co mm unit y and nos oco mia l)</i>	Intrinsic: solid cancer; post-urethral trauma; diabetes mellitus; immunodeficiency.	Ability to adhere to human tissues and to form biofilms in urinary catheters.	Ampicillin-sulbactam; piperacillin-tazobactam; ceftriaxone; cefepime; ertapenem; ciprofloxacin; nitrofurantoin; amikacin; gentamicina; tobramycin; TMP-SMX.	Ampicillin and other aminopenicillins; amoxicillin; amoxicillin-clavulanic acid; ticarcillin-clavulanic acid; piperacillin-tazobactam; ceftriaxone; third-generation cephalosporins; carbapenems; quinolones; aminoglycoside; co-trimoxazole; ciprofloxacin. Expresses β-lactamase.	Uroculture; Vitek 2 GN ID card, (BioMérieux) confirmed by 16S rRNA molecular methods; API 20E test kit (BioMérieux) or MicroScan Neg Combo 32 panel (Dade Behring) completed by an ornithine decarboxylase (ODC) test; MALDI-TOF MS.
Extrinsic: post-invasive procedures (urinary catheters).					
<i>Sal mo nell a spp. (co mm unit y)</i>	Intrinsic: sickle cell anemia; systemic lupus erythematosus; diabetes mellitus; chronic diseases; genitourinary structural abnormalities (lithiasis, chronic pyelonephritis, urethrorectal and retrovesicular fistula); immunosuppression; gastroenteritis; benign prostatic hyperplasia; recent episode of typhoid fever (chronic carrier); extremes of age; middle aged women; schistosomiasis; strongyloidosis; bad T-cell function.	Biofilm.	Cefotaxim; nalidixic acid; ceftriaxone; cefixim; ciprofloxacin; gentamicin; preference for third generation cephalosporins and fluoroquinolones.	Chloramphenicol; TMP-SMX.	Blood culture; Uroculture (CLED agar; UriSelect 4 , chromogenic agar); genus identification , with 20E analytical profile and mass spectrometry; serotype identification with agglutination method; serotyping with agglutination with O9 and Hd antisera (Denka, Seiken Co. Ltd).
Extrinsic: food or water contaminated; animals contaminated (commonly chickens and others birds); anal-penetrating intercourse.					

<i>Aer</i>	Intrinsic: elderly patients with genitourinary tract abnormality; immunocompromise (co d patients; mm urogenital or unit neurological abnormalities.	Antiphagocytosis; adherence; endotoxin; intracellular growth/survival ; stress proteins; biofilm formation (only A. sanguinicola); betahemolysin/cytolysin.	Penicillin; ampicillin; cefuroxime; vancomycin; erythromycin; rifampicin.	Co-trimoxazole; ciprofloxacin.	DNA sequencing; Mass spectrometry technology; 16S rRNA gene sequencing;	(3 3 - 3 5)
<i>l)</i>	Extrinsic: alcohol abuse.				blood culture (incubated in a CO2-enriched atmosphere).	
<i>Gro</i>	Intrinsic: vesicoureteric reflux.	-	Penicillin; erythromycin; clindamycin.	-	-	3 6

y)	Extrinsic: HIV/AIDS, organ transplantation, chemotherapy recipients, close contact with animals.					

<i>Geo</i>	Intrinsic: immunocompromise d patients; hematological malignancies and severe neutropenia.	-	Amphotericin B. Flucytosine; fluconazole; itraconazole.	Sabouraud dextrose agar and ID 32C (bioMérieux); ITS rDNA sequences and nDNA/DNA reassociation.	5
<i>um</i> (co mm unit y)	Extrinsic: use of corticosteroids; broad-spectrum antibiotics; cytotoxic chemotherapy; central catheter and the alteration of local defenses by obstruction of breakdown of the skin and mucosa.				
<i>Sac</i> <i>cha</i> <i>rom</i> <i>yce</i> <i>s</i> <i>cer</i> <i>cer</i> <i>evis</i> <i>iae</i> (co mm unit y)	Intrinsic: malignancy; HIV/ AIDS; chronic kidney disease (CKD); diabetes; newborns; obstructive uroopathy.	Common colonizer of the human respiratory, gastrointestinal and urinary tracts and is generally considered as a benign organism.	Amphotericin B; 5- flucytosine; ketoconazole; fluconazole; itraconazole; voriconazole; posaconazole; isavuconazole; micafungin.	- Pathogenic strains of <i>S.</i> <i>cerevisiae</i> exhibit the ability to grow at 42°C, produce proteinase and are capable of pseudohyphal growth.	5 6
<i>Tric</i> <i>hos</i> <i>por</i> <i>on</i> <i>asa</i> <i>hii</i> (co mm unit y and nos oco mia l)	Intrinsic: urinary obstruction; age; immunocompromise d patients; patients with haematologic malignancies profoundly neutropenic; hypertension; heart failure; chronic obstructive pulmonary disease; diabetes.	Biofilms, enzymes, and cell wall components.	Triazoles (voriconazole).	Echinocandins; 5- fluorocytosine.	Mycological study based on direct examination; Vitek 2 system; PCR and DNA sequencing of the internal transcribed spacer (ITS) and IGS regions of the rRNA genes; uroculture in Cornmeal Tween 80 agar.
<i>Zyg</i> <i>omy</i> <i>cete</i> <i>s</i> (co mm unit y)	Intrinsic: is related to occur in patients previously healthy, developing kidney failure and signs of sepsis.	Angiotropic (vascular invasion and infarction of the tissues).	Amphotericin B. -	Kidney biopsy. Grow in standard laboratory media within 12–18 h after sample inoculation.	6 1
