

Using the metabolism model of GH-Method: math-physical medicine to study geriatric concerns

Introduction

This paper addresses certain geriatric issues by using GH-Method: math-physical medicine (MPM) approach, particularly the mathematical metabolism model developed by the author in 2014.

Methods and results

As shown in Figure 1, the chronic diseases distribution map of adults over 65 years is as follows from CDC (2007-2008):

Endocrine chronic diseases:

Hypertension 56%

Heart diseases 33%

Cancer 23%

Diabetes 19%

Stroke 9%

Non-endocrine chronic diseases:

Arthritis 49%

Asthma 11%

Bronchitis 9%

It is obvious that endocrine-related chronic diseases are the major concerns. The author has been living with severe type 2 diabetes for 25 years and has suffered five cardiac episodes, renal complications, retinal problems, bladder infections, foot ulcer, and thyroid issues. Therefore, he started to self-study diabetes since 2010. In 2014, he

utilized his learned medical knowledge of metabolic disorders with finite-element modeling technique of structural and mechanical engineering and advanced mathematics to develop a mathematical metabolism model. This model contains 10 categories (Figure 2: body output: weight, glucose, blood pressure, lipid; body input: food, exercise, sleep, stress, water drinking, routine life patterns) and ~500 detailed elements to calculate two dynamic variables, metabolism index (MI) and general health status unit (GHSU). Based on continuous data input, an APP on the smartphone can show both MI and GHSU continuously and dynamically on the screen to inform patients about their general health status, especially endocrine-related chronic disease conditions through body outputs (Figure 3). By using his research results and developed tool, his overall chronic disease conditions and complications, caused by his elevated glucose and HbA1C, are all under control (Figure 4).

Figure 1 Chronic diseases among age >65 (2007-2008) .

Figure 2 10 categories of metabolism model.

Since the author is over 72 years old, in 2019, he started to self-study and research on geriatric diseases and disorders. He found that his developed metabolism model is extremely useful for older adults (geriatric population) as well as keeping their health conditions under control. The major differences between younger adults and older adults are in the areas of aging influences and “abnormal” metabolic conditions associated with aging. Therefore, the author has decided to expand and also augment his AI system within three selected categories (exercise, regular check-up, routine life pattern and home safety) to cover those geriatric concerns.

First, the pathophysiological changes are quite similar to his original chronic diseases design (items 1 through 9). He added in bones/muscle/dental/skin changes (10), five sensory changes (11), and mental/psychological changes (12) as shown below:

Routine check-up of geriatrics disorders:

Pathophysiological Changes:

(1) cardiovascular, cerebrovascular

- (2) endocrine (glucose, BP, lipids)
- (3) brain, nervous system (dementia, pain)
- (4) mental functions (depression)
- (5) gastrointestinal
- (6) pulmonary
- (7) renal, urinary, reproductive
- (8) sleep disorders
- (9) nutritional status & vitamin supplements
- (10) osteoporosis, musculoskeletal, dental, integumentary
- (11) sensory changes (vision, hearing, taste, smell, touch)
- (12) emotional and psychological changes
- (13) Special notes for geriatrics: medications review (should be < four different kinds & reduced dosage), BMI (should be >20, no lower).

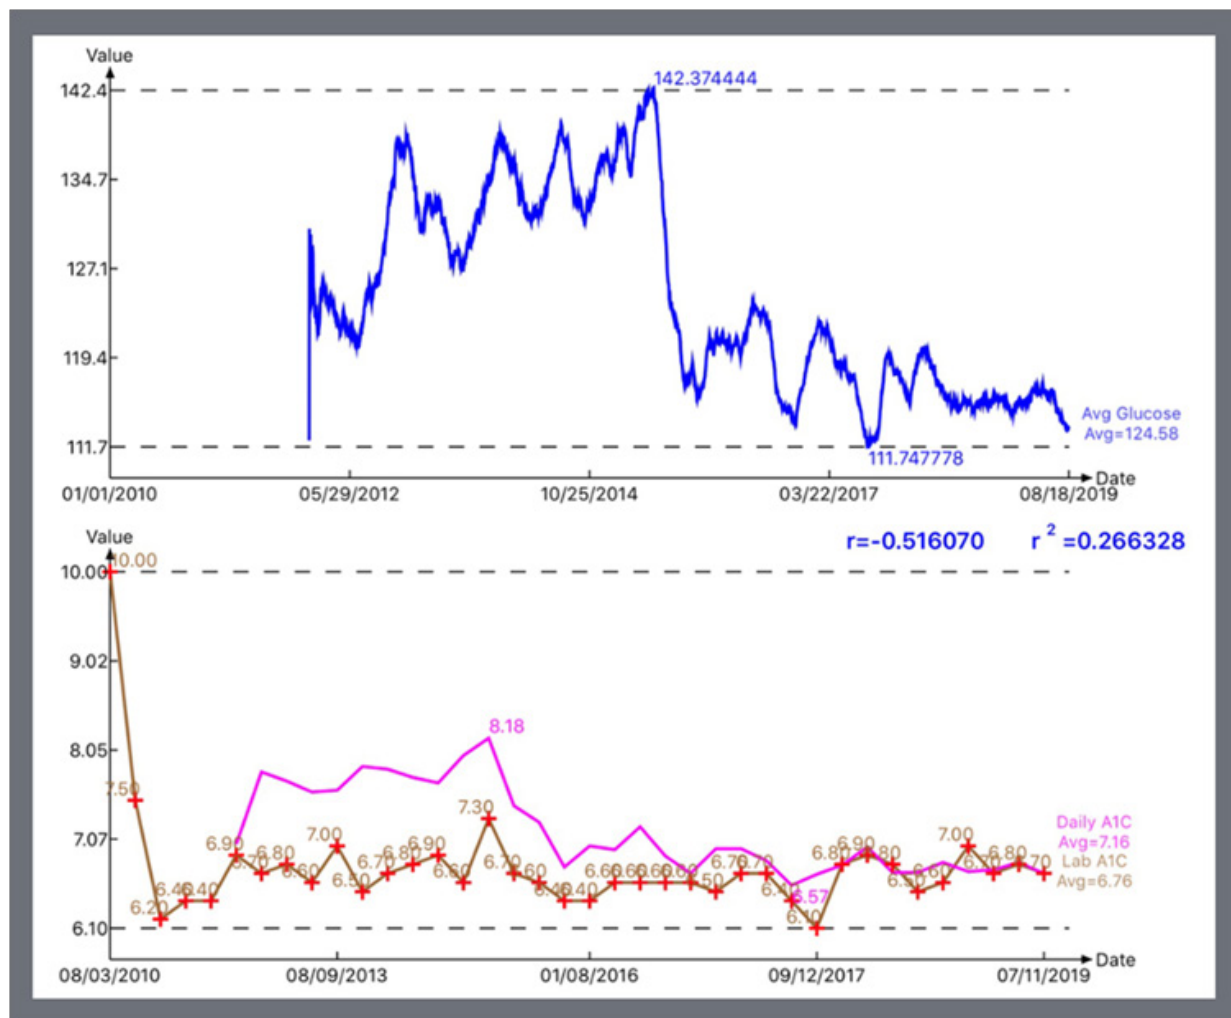

Figure 3 Metabolism Index (MI) & General Health Status Unit (GHSU).

Second, in order to accommodate additional five people exercise requirements for geriatric concerns, he expanded his daily routine major exercise for walking to include tai-chi, yoga, water sports, and foot care in order to strengthen body balance, joint flexibility, and muscle strength (see list below).

Exercise for senior adults:

- (14) maintain major daily exercise (e.g. walking)
- (15) balance & joint flexibility (e.g. tai chi, yoga, water sports)
- (16) muscle and bone strength
- (17) feet, toenails, comfortable shoes
- (18) physical therapy if necessary.

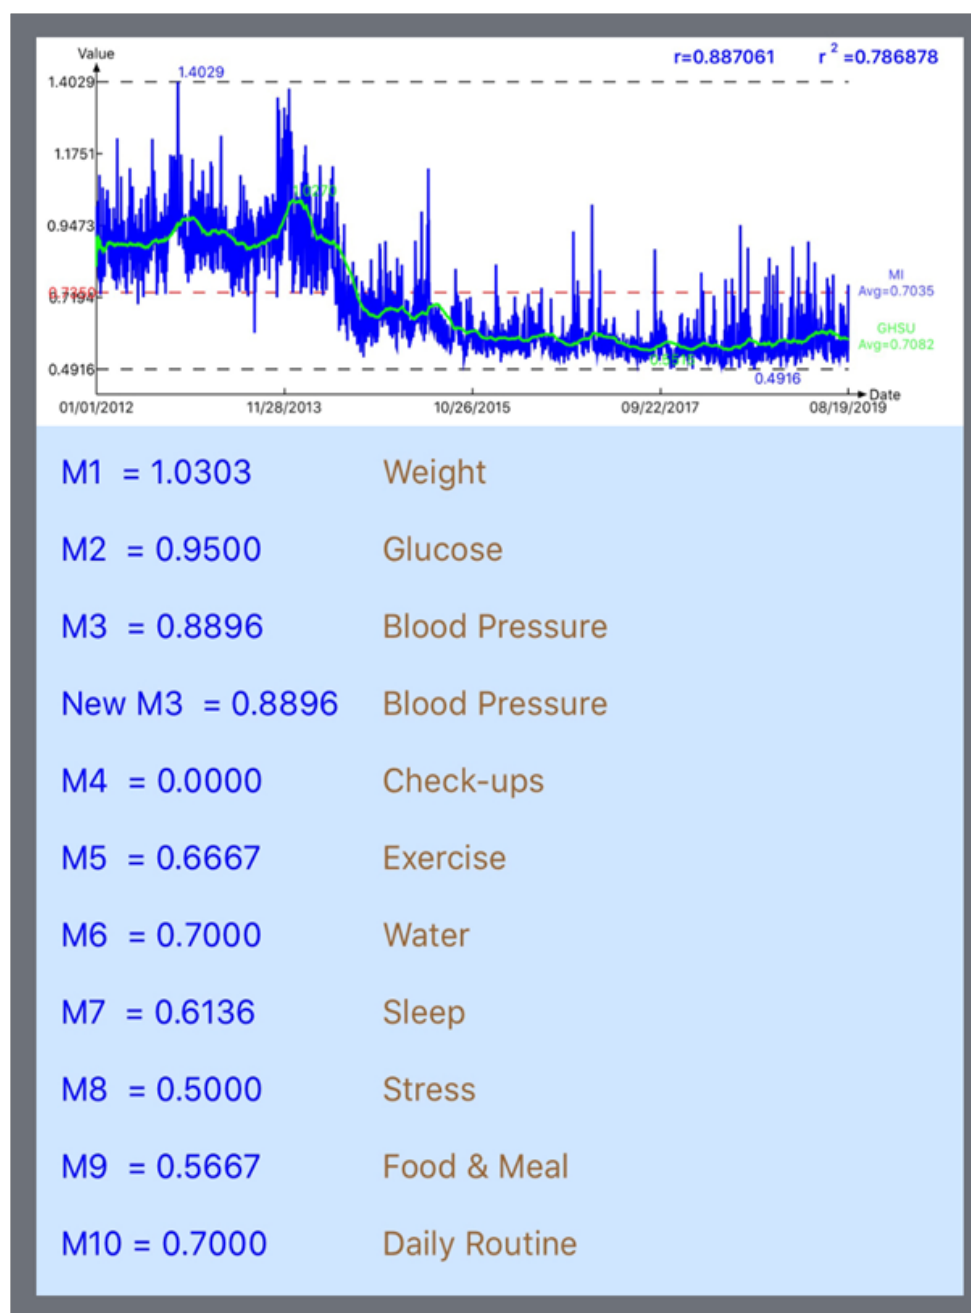

Figure 4 Daily glucose and HbA1C (2010-2019).

Third, in order to prevent accidental injury or even fatality from falling, he added in the following eight “Home Safety” items into his “Routine Life Patterns”.

Home safety for senior adults:

- (19) avoid cords, wires, loose rugs
- (20) install grab rails, fall proof devices
- (21) safe bath/shower room, use shower chair & bath brush for back and lower legs
- (22) good lighting
- (23) air conditioner and humidifier
- (24) cane or walker, walk on smooth and non-slippery pavements
- (25) caution for steps/stairs and moving traffic safety
- (26) have an emergency alarm or alert system linked to caretaker or healthcare personnel
- (27) have easy access for ambulance

The geriatric items mentioned above are included to serve as either a daily status check or a reminder for seniors to follow or to install them. Through the APP on handheld devices, the overall quality of

health and life extension of a senior citizen can be easier monitored and then maintained (Figure 5) (Figure 6).

Routine check-up of geriatrics diseases or disorders:	
cardiovascular, cerebrovascular	<input type="button" value="Yes"/> <input type="button" value="No"/>
endocrine (glucose, BP, lipid)	<input type="button" value="Yes"/> <input type="button" value="No"/>
brain, nervous (dementia, pain)	<input type="button" value="Yes"/> <input type="button" value="No"/>
mental functions (depression)	<input type="button" value="Yes"/> <input type="button" value="No"/>
gastrointestinal	<input type="button" value="Yes"/> <input type="button" value="No"/>
pulmonary	<input type="button" value="Yes"/> <input type="button" value="No"/>
renal, urinary, reproductive	<input type="button" value="Yes"/> <input type="button" value="No"/>
musculoskeletal	<input type="button" value="Yes"/> <input type="button" value="No"/>
osteoporosis	<input type="button" value="Yes"/> <input type="button" value="No"/>
integumentary	<input type="button" value="Yes"/> <input type="button" value="No"/>
vision, hearing, dental, taste, smell	<input type="button" value="Yes"/> <input type="button" value="No"/>
sleep disorders	<input type="button" value="Yes"/> <input type="button" value="No"/>
nutrition status	<input type="button" value="Yes"/> <input type="button" value="No"/>

GERIATRICS	
Home safety for senior adults:	
avoid cords, wires, loose rugs	<input type="button" value="Yes"/> <input type="button" value="No"/>
install grab rails, fall proof devices	<input type="button" value="Yes"/> <input type="button" value="No"/>
safe bath/shower room, use shower chair & bath brush	<input type="button" value="Yes"/> <input type="button" value="No"/>
good lighting	<input type="button" value="Yes"/> <input type="button" value="No"/>
air conditioning and humidifier	<input type="button" value="Yes"/> <input type="button" value="No"/>
cane or walker, walk on smooth pavements	<input type="button" value="Yes"/> <input type="button" value="No"/>
watch out for steps/stairs and moving traffic safety	<input type="button" value="Yes"/> <input type="button" value="No"/>
have an emergency alarm or alert system	<input type="button" value="Yes"/> <input type="button" value="No"/>
easy access for ambulance	<input type="button" value="Yes"/> <input type="button" value="No"/>
Exercise for senior adults:	
maintain major daily exercise (walking)	<input type="button" value="Yes"/> <input type="button" value="No"/>
balance & joint flexibility (taichi, yoga, water sports)	<input type="button" value="Yes"/> <input type="button" value="No"/>
muscle and bone strength	<input type="button" value="Yes"/> <input type="button" value="No"/>
feet, toe nails, comfortable shoes	<input type="button" value="Yes"/> <input type="button" value="No"/>
physical therapy if necessary	<input type="button" value="Yes"/> <input type="button" value="No"/>

Figure 5 Three additional components for Geriatrics concerns.

Conclusion

Geriatrics is a summarized or combined branch of nearly all of the internal medical branches. Metabolic disorder is the fundamental source of many chronic diseases. High glucose level is also the root cause of diabetes which leads into many complications of the internal organs.

Although these six metabolic lifestyle categories, which include food & diet, exercise, sleep, stress, water intake, routine life pattern, and home safety are critical to endocrine diseases, they also serve as major risk factors for longevity. As shown in Figure 6 (from Bradley Wilcox, MD, JABSOM University of Hawaii), even at age 90, there

are major differences between survival probability of 77% with no risk factors and survival probability of 43% with 5+ risk factors. Therefore, in order to have longevity, it is never too late to maintain a good lifestyle by paying attention to these metabolic lifestyle categories.

By using the GH-Method: math-physical medicine to expand his research results for chronic diseases into the area of geriatrics is a natural extension of his medical research work. His previous mathematical and physical models, quantitative analytics and engineering techniques, various statistical analysis tools are all extremely useful for his study and research of geriatrics.

Figure 6 Longevity life risk factors affect probability of survival.

Acknowledgments

First and foremost, the author wishes to express his sincere appreciation to a very important person in his life, Professor Norman Jones at MIT and University of Liverpool. Not only did he give him the opportunity to study for his PhD at MIT, but he also trained him extensively on how to solve difficult problems and conduct any basic scientific research with a big vision, pure heart, and integrity.

The author would also like to thank Professor James Andrews at the

University of Iowa. He helped and supported him tremendously when he first came to the United States. He believed in him and prepared him to build his solid engineering and computer science foundation. He is forever grateful to his mentor, who has a kind heart and guided him during his undergraduate and master's degree work at Iowa.

Conflicts of interest

The authors declare have no conflict of interest about the publication of this paper.
