Cinnamomum: review article of essential oil compounds, ethnombotany, antifungal and antibacterial effects

Abstract

Aromatic as well as medicinal plant species have played important roles in the lives of tribal people living in the Himalaya by providing products for both food and medicine. This review presents a summary of ethnombotanical, antibacterial, antifungal and volatile compounds of essential oils of some Cinnamomum species from the Nepal, Assam, Karnataka, and Indian Himalaya. This review illustrates the various prospective of cinnamon and its use in daily life.

Keywords: Cinnamomum, ethnombotany, antifungal, antibacterial, essential oil, India, food and medicine

Introduction

Spices played an important role in the history of exploration and development, are no longer luxury items of great cost. With the advent of refrigeration, there is less demand in the west to preserve and flavour foods at home, but they are widely used by the meat, sauce, canning, frozen food industry generally. They are also used in the cosmetic and perfumery industries, including its use in soap and toothpaste. Spices, or their essential oil, are of some importance in the preparation of liqueurs and cordials. They are also used in various ayurvedic and allopathic medicine. Bakers use it liberally in cookies and in hot drinks. Cinnamomum are said to be among the oldest spices Cinnamomum has fragrant, sweet and warm taste. Commercial essential oil production industry used several aromatic plant species for extracting high quality essential oil. Cinnamon is a highly valued spice whose bark is widely used as a spice. It is mainly used in cookery as a spice and by various industries for foodstuff, flavouring agent for fragrance and essence perfumes, and medicinal products.1 Cinnamomum stands out of all spices in its “warmth” and ranks as second to pepper. As spices, cinnamon is considered one of the finest sweet spices.

It is indigenous in Sri Lanka, which still produces the largest quantity and best quality, mainly in the form of quills. This genus contains evergreen trees or shrubs belongs to Lauraceae family contain around 250 species in tropical and subtropical regions, mostly in Asia and some in South and Central America, and Australia2 however, in Himalayan region only eight species i.e. Cinnamomum bejolghota (Buch.-Ham.) Sweet, Cinnamomum camphora (L.) J. Presl, Cinnamomum glanduliferum (Wall.) Meisn, Cinnamomum glaucescens (Nees) Hand.-Mazz., Cinnamomum impressivernium Meisn., Cinnamomum parthenoxylon (Jack) Meisn., Cinnamomum tamalca (Buch.-Ham.) Nees and Eberm., and Cinnamomum zeylanicum Breyn is found Imani et al.,3 reported noticeable improvement in digestion, as well as appetite stimulating properties in recent research. In another report, Vangalapati et al.,4 reported that in ancient Egypt cinnamon was used for beverage flavouring, as well as to treat illnesses. Moreover, it has been frequently used in savoury cuisines, Persian sweets soups and pickles. In conventional Chinese medicine, cinnamon has been used as a potential neuroprotective agent,5 as well as a potent medicine for the control and treatment of type 2 diabetes mellitus.6 Cinnamomum species are commercially valuable source of camphor, cinnamaldehyde and safrol oil in the world. This review presents a summary of Cinnamomum species from the Indian Himalaya, Nepal, and Bhutan, focusing on their ethnombotanical uses with the volatile compounds.

Methodology

The current review was conducted using a complete and organized search of the available literature on the medicinal plant cinnamon by using the keywords: essential oil, Himalaya, India, Nepal, Assam, Karnataka, and Indian Himalaya. The searches were performed using various databases, including PubMed (http://www.ncbi.nlm.nih.gov/pubmed), Science Direct (http://www.sciencedirect.com/), Scopus (http://www.scopus.com/), Scirus (http://www.scirus.com/), and Google Scholar (http://www.google.com/).

Distribution

Sri Lanka is the major Cinnamon growing country along with Seychelles, Madagascar and India.7 Best quality of cinnamon bark, mainly as quills is produced by Sri Lanka. Sri Lanka and Seychelles have approx 24,000 ha and 3400 ha area under cultivation producing around 12,000 t and 600 t cinnamon respectively.8 Cinnamon leaf oil is mostly produced in these countries, though the bark oil is distilled mostly in the importing countries. Sri Lankan export is to the tune of around 120 t of leaf oil and 4–5 t of bark oil.9

Cultivation of cinnamon

Around 27,000-35,000 annual tons cinnamon is globally produced.10 It is mostly raised in China, Seychelles, Madagascar and Sri Lanka; additionally, it’s cultivated on a little scale in Vietnam and India. It’s a hardy plant in terms of its suitableness for its cultivation in various weather conditions. The optimal temperature for the cultivation of cinnamon ranges between 20 to 30°C, with a yearly rainfall ranging between 1250 to 2500 mm. Cinnamon is usually propagated by dried seed and vegetative propagation (Table 1).11

Discussion and Conclusion

IUCN red listed twenty-four *Cinnamomum* species. Cinnamomum are facing great pressure and threat because of economic activities, especially manual picking of bark and fruits as spice and for their medicinal value. Due to the unregulated use and overexploitation, its number is steadily decreasing. If the necessary conservation measures are not adopted, the species could become extinct. Genetic diversity data are important for conservation and management of rare and endangered species. Maintenance of genetic diversity is essential to the long term survival of the tree species without which there may be a risk of its extinction because of lack of adaptive ability. Cinnamomum possess immunomodulatory, antioxidant, antiviral, lowering a risk of its extinction because of lack of adaptive ability. Cinnamomum possess immunomodulatory, antioxidant, antiviral, lowering blood cholesterol, antimicrobial, lipid-lowering, antiinflammatory, anti tumor, gastroprotective, anti diabetic, neuroprotective and blood purifying properties. Therefore, future conservation and sustainable management programmes for the *Cinnamomum* species are an urgent priority.
